

Google Ads API - Tool Documentation

Niche Finance Keyword Dashboard

1. Application Overview

The Niche Finance Keyword Dashboard is a self-hosted, internal-use keyword research tool designed to identify underpriced advertising opportunities in niche finance verticals within the Australian market.

The application tracks a curated list of niche finance search terms (e.g. 'jet ski finance', 'vending machine finance', 'solar panel finance') and monitors their search volume, cost-per-click (CPC), and competition levels over time to surface keywords that are low-competition and rising in interest.

2. How the Tool Uses the Google Ads API

The tool makes periodic calls (weekly) to the Google Ads API KeywordPlanIdeaService (GenerateKeywordIdeas) to retrieve keyword metrics for a maintained list of approximately 30-50 niche finance terms.

For each keyword, the following metrics are retrieved:

- Average monthly search volume
- Competition level (LOW / MEDIUM / HIGH)
- Top-of-page bid estimates (low range and high range CPC)
- Month-over-month and year-over-year search volume trends

The retrieved data is stored in a local SQLite database and displayed on a private internal dashboard accessible only on the local network. No data is shared externally or with third parties.

3. API Usage Volume

The tool is designed for minimal API usage:

- Approximately 1 API call per week (batch of 30-50 keywords per request)
- No real-time or high-frequency usage
- No automated bidding, campaign creation, or ad management
- Read-only access to keyword planning data only

4. Architecture

The application consists of two lightweight Docker containers:

- A dashboard container serving a web UI (FastAPI/Python)
- A data puller container that runs the weekly keyword data retrieval

All data is stored locally in a SQLite database. The application runs on a private home server and is accessible only via the local network and Tailscale VPN. There is no public-facing component.

5. Users and Access

This is a single-user, internal tool. There are no external users, no customer-facing features, and no commercial redistribution of Google Ads data. The tool is used solely for personal keyword research to inform advertising strategy.

6. Compliance

The tool complies with the Google Ads API Terms of Service:

- No caching of data beyond what is permitted
- No redistribution of API data to third parties
- No automated campaign or bidding operations
- Minimal API call volume, well within rate limits
